Video: device and hardware architecture for simultaneous quantitative analysis and dynamic tHb measurement during high-intensity exercise. This paper describes a device and hardware architecture for simultaneous quantitative analysis and dynamic measurement of blood concentration of hemoglobin (Hb) for high-intensity exercise. A novel optical imaging technique was developed to image the local oxygen saturation (SO₂) at the muscle-tissue interface and to estimate the absolute Hb concentration based on the local SO₂. The device was integrated with a solid state laser, an LED, a CMOS camera and an image processing unit. The architecture and operation of the device were designed to allow continuous and real-time quantitative analysis and dynamic measurement
