Nonobese diabetic rat with spontaneous type 1 diabetes mellitus. To define and characterize the natural history of the type 1 diabetes (T1D) in the nonobese diabetic (NOD) rat, serum glucose levels and pancreatic histology were studied at weekly intervals. All NOD rats (n = 99) received oral glucose loads and were monitored at least twice a week for the first 20 weeks and then intermittently. Clinical diabetes was defined as two consecutive values greater than 300 mg/dl. Eighteen out of 99 (18%) rats developed T1D; median diabetes onset was 8 weeks (range 2 to 20). Histologic examination of pancreata from T1D-free rats (n = 56) showed a significant decrease in insulin-positive beta-cells and exocrine pancreas compared to a nondiabetic group (n = 4). Two spontaneously diabetic NOD rats developed insulinitis and were insulin positive. By 20 weeks of age, 26% of non-T1D NOD rats had become diabetic. Diabetes preceded weight gain and death by at least 6 weeks, and occurred in all age and sex groups. Our results indicate that NOD rats are prone to diabetes, and that clinical diabetes can be detected at an early stage.

Q: How to use keystore for debug signing of native android applications? I am trying to debug my android application using keystore file. I have created a keystore using keytool as follows, keytool -genkey -v -keystore deploy-debug.keystore -alias launchpad -keysize 2048 -validity 10000 And I also have signed apk using jarsigner -keystore build/intermediates/release/debug/myapp.apk C:\Users\hjalkar\Desktop\myapp.apk launchpad I got the following error when I try to debug my application.
