In animal models, L-cysteine S-sulfinate (CySS) has been shown to have an important role in the activation of mitochondrial 3-nitrotyrosine production by superoxide from the redox-cycling substrate nitric oxide. There is limited information on the formation of CySS in humans, particularly in the context of mitochondrial disease. This study compared the levels of plasma CySS in healthy volunteers and children with mitochondrial disease. Patients with mitochondrial disorders had significantly higher concentrations of CySS and 3-nitrotyrosine but lower levels of 3-methylhistidine compared to healthy volunteers. Importantly, the levels of CySS correlated with biomarkers of mitochondrial dysfunction such as 3-nitrotyrosine, 3-methylhistidine and lactate. These data add to evidence that CySS may be involved in mitochondrial dysfunction and may potentially be useful as a diagnostic marker for mitochondrial disease.We are now working with Doylestown Hospital to provide for patient care.
